Summary of Audit Results

After auditing, No vulnerabilities were found in the Light-Ecosystem-hope-oracle project. Specific audit details will be presented in the **Findings** section. Users should pay attention to the following aspects when interacting with this project:

• Project Description:

This part of the Hope-Oracle code is mainly used for the price prediction of the Hope token. The code realizes that the price of the Hope token depends on the corresponding value of the reserves of multiple assets, and the code ensures that the price of the Hope token cannot exceed \$1 (according to the description of the project side document, If the Hope token exceeds \$1, the Oracle will no longer apply and the chainlink Oracle will be used to price the Hope token). The price update depends on the fixed heartbeat time to update, if the price does not exceed or not below a certain threshold, the price of the Hope token will not be updated.

1 Overview

1.1 Project Overview

Project Name	Light-Ecosystem-hope-oracle	
Platform	Ethereum Blacketialii Security	
GitHub	https://github.com/Light-Ecosystem/hope-oracle/tree/audit	
Commit	10f42a069a6dbc09e5822f14be62fd95fedab826	

1.2 Audit Overview

Audit work duration: June 20, 2023 – July 19, 2023

Audit methods: Formal Verification, Static Analysis, Typical Case Testing and Manual Review.

Audit team: Beosin Security Team.

2 Appendix

2.1 Vulnerability Assessment Metrics and Status in Smart Contracts

2.1.1 Metrics

In order to objectively assess the severity level of vulnerabilities in blockchain systems, this report provides detailed assessment metrics for security vulnerabilities in smart contracts with reference to CVSS 3.1 (Common Vulnerability Scoring System Ver 3.1).

According to the severity level of vulnerability, the vulnerabilities are classified into four levels: "critical", "high", "medium" and "low". It mainly relies on the degree of impact and likelihood of exploitation of the vulnerability, supplemented by other comprehensive factors to determine of the severity level.

Impact Likelihood	Severe	High	Medium	Low
Probable	Critical	High	Medium	Low
Possible	High	High	Medium	Low
Unlikely	Medium	Medium	Low	Info
Rare	Low	Low	Info	Info

2.1.2 Degree of impact

Severe

Severe impact generally refers to the vulnerability can have a serious impact on the confidentiality, integrity, availability of smart contracts or their economic model, which can cause substantial economic losses to the contract business system, large-scale data disruption, loss of authority management, failure of key functions, loss of credibility, or indirectly affect the operation of other smart contracts associated with it and cause substantial losses, as well as other severe and mostly irreversible harm.

High

High impact generally refers to the vulnerability can have a relatively serious impact on the confidentiality, integrity, availability of the smart contract or its economic model, which can cause a greater economic loss, local functional unavailability, loss of credibility and other impact to the contract business system.

Medium

Medium impact generally refers to the vulnerability can have a relatively minor impact on the confidentiality, integrity, availability of the smart contract or its economic model, which can cause a small amount of economic loss to the contract business system, individual business unavailability and other impact.

Low

Low impact generally refers to the vulnerability can have a minor impact on the smart contract, which can pose certain security threat to the contract business system and needs to be improved.

2.1.4 Likelihood of Exploitation

Probable

Probable likelihood generally means that the cost required to exploit the vulnerability is low, with no special exploitation threshold, and the vulnerability can be triggered consistently.

Possible

Possible likelihood generally means that exploiting such vulnerability requires a certain cost, or there are certain conditions for exploitation, and the vulnerability is not easily and consistently triggered.

Unlikely

Unlikely likelihood generally means that the vulnerability requires a high cost, or the exploitation conditions are very demanding and the vulnerability is highly difficult to trigger.

Rare

Rare likelihood generally means that the vulnerability requires an extremely high cost or the conditions for exploitation are extremely difficult to achieve.

2.1.5 Fix Results Status

Status	Description	
Fixed	The project party fully fixes a vulnerability.	
Partially Fixed The project party did not fully fix the issue, but only mitigated the issue.		
Acknowledged	The project party confirms and chooses to ignore the issue.	(967) B

2.2 Audit Categories

No.		Categories	Subitems
			Compiler Version Security
		SIN	Deprecated Items
1		Coding Conventions	Redundant Code
		require/assert Usage	
			Gas Consumption
IN		REOSIN	Integer Overflow/Underflow
	ing these fits and by	Receipty and oily	Reentrancy
		Pseudo-random Number Generator (PRNG)	
	SINI	Transaction-Ordering Dependence	
		Security	DoS (Denial of Service)
	2 Gen	General Vulnerability	Function Call Permissions
2			call/delegatecall Security
			Returned Value Security
	BEOSIN	tx.origin Usage	
			Replay Attack
			Overriding Variables
	SIN	Third-party Protocol Interface Consistency	
3	30 3 to 100 to 100 100 100 100 100 100 100 100 100 10		Business Logics
			Business Implementations
	REOSIN	Manipulable Token Price	
	Business Security	Centralized Asset Control	
		Asset Tradability	
		SIN	Arbitrage Attack

Beosin classified the security issues of smart contracts into three categories: Coding Conventions, General Vulnerability, Business Security. Their specific definitions are as follows:

Coding Conventions

Audit whether smart contracts follow recommended language security coding practices. For example, smart contracts developed in Solidity language should fix the compiler version and do not use deprecated keywords.

• General Vulnerability

General Vulnerability include some common vulnerabilities that may appear in smart contract projects. These vulnerabilities are mainly related to the characteristics of the smart contract itsLight-Ecosystem-hope-oracle, such as integer overflow/underflow and denial of service attacks.

Business Security

Business security is mainly related to some issues related to the business realized by each project, and has a relatively strong pertinence. For example, whether the lock-up plan in the code match the white paper, or the flash loan attack caused by the incorrect setting of the price acquisition oracle.

^{*}Note that the project may suffer stake losses due to the integrated third-party protocol. This is not something Beosin can control. Business security requires the participation of the project party. The project party and users need to stay vigilant at all times.

2.3 Disclaimer

The Audit Report issued by Beosin is related to the services agreed in the relevant service agreement. The Project Party or the Served Party (hereinafter referred to as the "Served Party") can only be used within the conditions and scope agreed in the service agreement. Other third parties shall not transmit, disclose, quote, rely on or tamper with the Audit Report issued for any purpose.

The Audit Report issued by Beosin is made solely for the code, and any description, expression or wording contained therein shall not be interpreted as affirmation or confirmation of the project, nor shall any warranty or guarantee be given as to the absolute flawlessness of the code analyzed, the code team, the business model or legal compliance.

The Audit Report issued by Beosin is only based on the code provided by the Served Party and the technology currently available to Beosin. However, due to the technical limitations of any organization, and in the event that the code provided by the Served Party is missing information, tampered with, deleted, hidden or subsequently altered, the audit report may still fail to fully enumerate all the risks.

The Audit Report issued by Beosin in no way provides investment advice on any project, nor should it be utilized as investment suggestions of any type. This report represents an extensive evaluation process designed to help our customers improve code quality while mitigating the high risks in blockchain.

2.4 About Beosin

Beosin is the first institution in the world specializing in the construction of blockchain security ecosystem. The core team members are all professors, postdocs, PhDs, and Internet elites from world-renowned academic institutions. Beosin has more than 20 years of research in formal verification technology, trusted computing, mobile security and kernel security, with overseas experience in studying and collaborating in project research at well-known universities. Through the security audit and defense deployment of more than 2,000 smart contracts, over 50 public blockchains and wallets, and nearly 100 exchanges worldwide, Beosin has accumulated rich experience in security attack and defense of the blockchain field, and has developed several security products specifically for blockchain.
